Randy Production Platform: Development Proposal and Value Breakdown

Prepared: 9 November 2026 **Currency:** Kenyan shillings (KES) **Proposal type:** Fixed-price freelance development proposal. The amounts below are a scope-based estimate, not an hourly quote, timesheet, tax invoice, or independent valuation. An indicative software-company planning estimate is included for comparison.

Project understanding and technical assumptions

The estimate reflects the platform's public quote and planning journeys, Client Portal, Studio and Admin workspaces, authentication and role boundaries, database and migration setup, responsive/PWA experience, quality checks, deployment configuration, and documentation. KES 456,000 is the proposed freelance fee for the defined scope below. It does not imply that every possible feature or production integration is included.

The deployment plan is **Vercel for application hosting, Supabase for PostgreSQL, Cloudflare for domain DNS, and Resend for passwordless email**. The application uses Better Auth for sign-in and connects to Supabase through its PostgreSQL connection; Supabase Auth is not part of this implementation.

Vercel runtime traffic will use Supabase's transaction pooler, and deployment migrations will use a separate direct database connection where available. Cloudflare will manage DNS records that point the custom domain to Vercel; the recommended configuration leaves those records DNS-only rather than placing a second proxy in front of Vercel. Service subscriptions, domain renewal, and usage-based provider charges are operating expenses, separate from the one-time development fee.

Investment overview

> **Freelance development fee: KES 456,000**, before VAT if legally chargeable. Third-party operating costs and ongoing support are separate.

This fixed-value proposal is based on the business outcomes and deliverables in the agreed scope—not hours or lines of code. It covers the public enquiry journey, connected client and operations workspaces, access controls, quality checks, and handover. It does not guarantee a particular increase in sales or reduction in operating costs.

For comparison, development of a substantially similar broad platform by a software company may have an indicative planning budget of **KES 1,800,000 to KES 2,600,000**, depending on discovery, team size, formal project management and QA, warranty, support commitments, and integrations. This is a planning range, not a quotation from a specific company or an official Kenyan tariff; the deliverables and service levels must be compared directly.

What the client is paying for

The proposed scope is more than a marketing website. It includes:

- A public website and portfolio, with quote, package-matching, and event planning journeys.
- Sign-in and role-based access for clients, invited staff, and administrators.
- A client portal for projects, approvals, payment terms, invoices, payment reports, receipts, and timelines.
- A production workspace for jobs, briefs, reviews, schedules, crew, collaboration, gear, vendors, merchandise, and case-study workflows.
- An Admin workspace for access invitations, finance, operations, approved public updates, and planning guidance.
- Database and migrations, responsive layouts, PWA support, integration boundaries, tests, and deployment/handover work.

The platform connects customer acquisition to project delivery: the business can collect a lead, preserve and review a scope, coordinate production, keep clients informed, and track approvals and financial records in one product. This is intended to support more consistent administration and handoffs. Actual business results depend on adoption and operations and are not guaranteed by the development work.

Interface-by-interface explanation

The proposal covers a connected set of interfaces for different users, rather than a single screen. Each supports a different part of the production journey. The next section shows how the KES 456,000 freelance fee is allocated across these outcomes and their shared foundations.

Public interfaces: prospective clients and visitors

- **Home and main navigation (`/`):** introduces the studio and routes visitors to services, examples of work, planning tools, and contact/quote actions.
- **Portfolio and project stories (`/work`, `/cases/:slug`):** lets potential clients browse work and understand the studio's production capabilities.
- **Public Studio Updates (`/transparency`):** presents only approved, client-safe updates; it is distinct from internal project notes.
- **Quote builder (`/quote`):** lets an organiser select event and service options, see an estimate, and prepare a request for the team to review.
- **Package guide (`/match`):** helps visitors choose a starting package and carry that choice into the quote flow.
- **Event planner (`/look`):** gathers event details and creative direction so a prospective client can form a brief before requesting a quote.

Where the value goes: the public-facing allocation covers the customer journeys, portfolio presentation, planning interactions, and handoff from exploration into a quote. The

recommendation and quote tools are planning assistance; they do not confirm availability or make an estimate a final invoice.

Sign-in, proposal, and booking interfaces

- **Sign-in and account creation (`/login`):** gives clients a way to enter the portal and invited staff a way to authenticate before accepting an invitation.
- **Proposal and booking (`/book/:quoteId`):** gives an authenticated client a place to review the proposed scope and estimate, sign the contract, and continue to the project workspace.

Where the value goes: the flow connects an enquiry to an identifiable client/project record and reduces the gap between a quote request and the project's next steps. Authentication, identity checks, and server-side access rules are part of the shared backend work as well as the visible screens.

Client interfaces: project dashboard and project workspace

- **Client dashboard (`/portal`):** gives each client a summary and list of their own projects, including work that is active, needs attention, or is complete.
- **Project overview (`/portal/:projectId`):** brings together the specific project's status, key details, and next actions.
- **Approvals:** lets a client review shared drafts, approve them, or request changes with feedback.
- **Billing and receipts:** presents proposed payment terms, invoices, payment reporting, and receipts for confirmed payments. An offline payment report is not treated as verified until Admin reviews it.
- **Timeline:** shows project progress and relevant event/show cues.
- **Profile and receipt detail (`/portal/profile`, `/portal/:projectId/receipts/:receiptId`):** supports account details and access to an individual confirmed receipt.

Where the value goes: the Client Portal allocation pays for the client side of project delivery—visibility, approvals, billing context, and updates. The client sees their project information without gaining access to another client's records.

Studio interfaces: staff desk and production tools

- **Studio desk (`/studio`):** a staff dashboard for active jobs, upcoming productions, and work needing attention.
- **Job pipeline (`/studio/pipeline`):** a production board for following work from job intake through operational stages.
- **Briefs and reviews (`/studio/briefs`, `/studio/reviews`):** tools for handling project information and client-facing creative review work.
- **Run sheet and live show view (`/studio/runsheet`, `/studio/live/:projectId`):** support schedules, cues, and the active production view.
- **Crew (`/studio/crew`):** organizes crew assignments and call information.
- **Team collaboration (`/studio/collaboration`):** gives staff channels and shared communication, with message-related collaboration features.
- **Resources (`/studio/gear`, `/studio/vendors`, `/studio/merch`):** support equipment, supplier, and merchandise operations.
- **Case Forge (`/studio/marketing`) and team profile (`/studio/profile`):** support case-study/testimonial work and staff account details.

Where the value goes: the Studio allocation is larger because it covers multiple connected operational interfaces, not just a dashboard. These tools help staff coordinate the work that must happen after a client says yes. They are production coordination tools; they do not replace the team's judgement or guarantee that a physical event will run without issues.

Admin interfaces: business oversight and control

- **Admin dashboard (`/admin`):** gives administrators an overview of people, finance, production readiness, and items requiring follow-up.
- **People and invitations:** lets an Admin prepare and track staff access. Invitations are tied to the invited email and do not by themselves grant Admin privileges.
- **Finance and receipts (`/admin/receipts`):** provides an administrative place to review financial records, offline payment reports, and receipts.
- **Operations:** highlights job readiness and operational follow-up.
- **Public update controls:** allow approved project information to be presented publicly without exposing internal/client-only records.
- **Knowledge base:** stores sourced planning guidance used by the package guide.

Where the value goes: the Admin allocation supports controlled access, financial oversight, operational review, and the business's ability to decide what project information is safe to publish. Authorization is enforced on the server for privileged operations, not only by hiding dashboard links.

Shared interface foundations

The interface work also includes responsive layouts for phone and desktop, shared navigation and visual patterns, form states, empty/loading/error feedback, and installable PWA behavior where supported. Backend and access work connects the interfaces to persistent records and makes sure each role can only use the data and actions it is allowed to access. Quality assurance and handover cover checks across the main journeys, fixes for in-scope defects, deployment assistance, and operating documentation.

Value allocation of the KES 456,000 freelancer fee

The following allocation explains what the client is paying to receive. These are fixed-value portions of one project fee, not hourly charges or separate third-party supplier quotations.

Workstream	Value (KES)	Where the value goes
Product discovery and solution architecture	25,000	Agreeing what each role needs, how visitors become clients, how a job proceeds, and where the service boundaries are.
UX/UI and responsive design	45,000	Shared navigation, mobile and desktop layouts, dashboard hierarchy, forms, and useful loading, empty, and error states across the interfaces.
Public website and enquiry flows	55,000	Home, portfolio, case stories, public updates, quote builder, package guide, event planner, and enquiry handoff.
Client portal and project lifecycle	75,000	Client project dashboard, project overview, approvals/feedback, payment terms, invoices, confirmed receipts, timeline, and profile.
Studio operations workspace	90,000	Staff desk, job pipeline, briefs, reviews, run sheet/live view, crew, collaboration, gear, vendors, merchandise, and Case Forge.
Admin, access, and finance workflows	55,000	Admin overview, staff invitations, finance/receipt review, operational readiness, publication controls, and planning knowledge base.
Backend, database, authentication, and authorization	55,000	Connecting interfaces to records, migrations, sign-in, role checks, ownership checks, and protected server-side operations.
Quality assurance and release hardening	35,000	Walking through the main visitor, client, staff, and Admin journeys; checking responsive behavior; correcting in-scope defects.
Deployment, documentation, and handover	21,000	Vercel deployment configuration, Supabase connection and migration settings, Cloudflare DNS handoff, operating notes, administrator orientation, and handover checklist.
Total	**456,000**	**Defined freelancer platform build, allocated by interface and business value—not a per-page or hourly charge.**

Why the backend and security work has a budget

Client projects, staff operations, and financial records are sensitive business data. The value is not just that each role has a different screen: server operations must also restrict actions and project records to the appropriate person. Database migrations, authentication configuration, and checks for authorization and data ownership help make the workflows reliable as the business grows.

This allocation does **not** mean the platform has undergone a formal independent penetration test, legal/privacy review, or certification. Those should be scoped and quoted explicitly if required.

What is included—and what is not

Included in the proposed development scope

- The public, Client, Studio, and Admin interfaces described above.
- The shared responsive layouts, application access controls, and database work described in the value allocation.
- Quality checks of the agreed user journeys and correction of in-scope defects.
- Deployment assistance, documentation, and handover as described in the signed project scope.

Not included unless added to the signed scope

- Native Android or iOS applications or app-store submission.
- Provider-specific live payment-gateway integration, provider onboarding, settlement testing, and reconciliation.
- SMS, WhatsApp, accounting, CRM, calendar, or other external integrations not named in the scope.
- Independent penetration testing, security certification, legal advice, or regulatory compliance certification.
- New features, unlimited revisions, content entry, photography, video, or ongoing copywriting.
- Hosting, domain registration, email sending, database usage, payment fees, or other third-party costs.
- Ongoing maintenance, support, or guaranteed uptime after the included handover/defect period.

The quote and planning tools produce estimates; they do not confirm availability, constitute a final invoice, or guarantee that a payment processor is enabled.

Proposed payment milestones

Each payment is tied to a visible delivery stage and client review. For the KES 456,000 freelance development fee:

Milestone	Share	Amount (KES)	Trigger
Project start and reserved delivery capacity	30%	136,800	Signed agreement, approved scope, and kickoff.
Approved journeys and interface direction	25%	114,000	Client approval of the agreed UX/prototype or equivalent design checkpoint.
Feature-complete staging review	25%	114,000	The scoped workflows are available for client review on staging.
Launch and handover	20%	91,200	Agreed acceptance checks pass, production handover is complete, and documentation is delivered.
Total	**100%**	**456,000**	

The final agreement will specify review windows, acceptance criteria, defect reporting, and responsibilities for providing content and approvals. Any request outside the agreed scope will be estimated and approved in writing before work begins.

Running costs after launch

The one-time development fee is separate from the recurring cost of operating the product. The domain, hosting, database, email, and payment-provider accounts should be owned and paid for by the client where practical. This keeps account ownership clear and lets actual provider usage determine the operating bill.

The planned service categories are:

- **Cloudflare:** domain DNS management and domain renewal depend on the selected plan and registrar. DNS records will point the domain to Vercel; the recommended setup uses DNS-only records, not Cloudflare's reverse proxy.
- **Vercel:** deployment/build hosting and usage-based platform services. Its pricing page lists Hobby at US$0/month and Pro at US$20/month before usage-based charges. The selected plan depends on commercial use, features, and traffic.
- **Supabase:** budget according to the selected project plan and database usage. The application database will be configured for Supabase PostgreSQL; database backups and migration connections should be verified before launch.
- **Resend:** email delivery for sign-in links and any other agreed transactional email. Charges and sending limits depend on the selected plan, volume, and domain verification.
- **Domain, file storage, monitoring, backups, and payment processing:** charged according to the selected provider and actual usage. Payment processing fees are separate from development and must be confirmed with the selected provider.

The handover will identify the production URL, Supabase database owner and backup responsibility, Cloudflare DNS records, Resend sender configuration, and billing account for each service.

The Vercel pricing page lists Hobby at US$0/month and Pro at US$20/month before usage-based charges. Actual Supabase, Cloudflare, and Resend costs depend on the selected plans and usage and should be confirmed from provider pricing and account details. These provider charges are not part of the KES 456,000 development fee.

Optional ongoing support

After the agreed defect-correction period, ongoing support may be arranged as a separate, renewable agreement. An example limited support package is:

- **KES 15,000–30,000 per month** for a clearly defined, limited support package.
- The support agreement will define the response window, covered maintenance tasks, exclusions, rollover policy, and process for approving additional work.
- Treat new features, major upgrades, incidents caused by third parties, and after-hours emergency work as separately quoted unless the agreement specifically includes them.

These monthly figures are a planning example, not an externally published Kenyan tariff. Final support fees depend on the agreed response window, maintenance coverage, and support commitment.

Tax and invoicing in Kenya

The Kenya Revenue Authority's VAT guidance says the general VAT rate is **16%** and that a person supplying, or expecting to supply, taxable goods/services worth **KES 5 million or more in a year** is required to register for VAT. The relevant threshold concerns taxable supplies over the year, not just this one contract. KRA also says VAT-registered persons must onboard on eTIMS.

The recommended freelancer build fee is **KES 456,000 before VAT if VAT is legally chargeable**. At 16%, VAT on that amount would be KES 72,960, making the total KES 528,960. If KES 456,000 must instead be the client's all-in maximum and VAT applies, the pre-VAT fee would be approximately KES 393,103 and VAT approximately KES 62,897. Agree which interpretation applies before finalizing the agreement. VAT will only be charged where legally applicable and reflected in a valid tax invoice. KRA's threshold concerns annual taxable supplies, not only this project; the applicable tax treatment depends on the supplier's circumstances. The parties should confirm the applicable treatment with KRA or a qualified Kenyan tax professional before invoicing.

Proposal basis and acceptance

This document is a development proposal and scope-based estimate, not a tax invoice or a claim that the fee is automatically payable for work performed before an agreement. The project begins

when both parties approve the written scope, schedule, acceptance criteria, payment milestones, and ownership and handover terms.

If the full scope does not fit the approved budget, the parties may agree to phase or reduce deliverables before work begins. Any feature, integration, or support commitment outside the signed scope will be separately estimated and approved in writing.

Kenya market and pricing sources

These public sources provide context for the proposal. They do not establish a single official Kenyan market rate:

1. Clutch: Top Software Developers in Kenya — directory accessed 9 November 2026; its listing for Nairobi-based Segue Interactive showed a **US$1,000+ minimum project size**. This is one vendor's advertised directory profile and is not a quote for this project's scope. Clutch notes it may earn fees for some placements.
2. Kenya Revenue Authority: Value Added Tax — source for the general VAT rate, registration threshold, and eTIMS guidance summarized above. Applicable rules should be confirmed before invoicing.
3. Vercel pricing — source for the example deployment plan prices. Supabase, Cloudflare, and Resend charges are account-specific operating expenses based on their selected plans and usage.

Because public Kenyan software-company prices are limited and not directly comparable, the **KES 1,800,000–2,600,000 company range is an indicative planning estimate**, not a formal quotation. Actual company fees depend on the agreed deliverables, service levels, integrations, and support arrangements.
